Figma Prototyping & System Design Prompt: IPASA System Refinements

1. Case Details & Layout Standardization

- **Consistent Collapsed Details:** Across all user roles, when case details are expanded or collapsed, they must uniformly display the exact same core content: inventor details, secondary inventors, and the case description.
- **Shared Interface Consistency:** Buttons and components shared across users and pages (such as the interface for handling response requests between applicants and case handlers) must use the identical layout, design language, and interactive structure.
- **Remark and Response Parity:** For remarks and response requests, copy the exact same interface style across roles where applicable. Allow multiple replies within remarks for both admins and case handlers so that all replies are visible under a unified thread.

Response request notifications and remark notifications must include a dedicated **close button** ($[x]$) so users can dismiss or close the notification immediately.

3. Completed IP Repository & Homepage Updates

- **Admin-Managed Repository:** The IP Repository must **not** display an "Inventor-approved" tag. Cases are uploaded exclusively by the TTBDO admin, who explicitly requests permission from the inventor prior to uploading.
- **Streamlined Filtering:** Improve the visual appearance of the repository filters by making them lighter and less visually heavy.
- **Homepage Section Removal:** Remove the marketing section containing *"Have an IP to disclose? Submit your IP disclosure through IPASA..."* along with the "Register Now" button from the homepage to reduce clutter.

4. Metrics, Resources, & Redundant Form Removals

- **Inclusive Metrics:** The analytics metrics for **FILED** and **REGISTERED** must encompass *all* IP types (including Patents, Utility Models, Trademarks, Copyrights, and Industrial Designs), rather than being limited to specific types.
- **Removal of Redundant Forms & Guidelines:** Remove downloadable blank forms and guidelines from the Resources section (both on the homepage and applicant home) since the system autopopulates forms automatically.
- **Sample Filled-Out Forms:** Replace the downloadable blank form templates in the resources/homepage view with **sample filled-out forms** for user reference.

5. Applicant Home & Cross-Role UI Consistency

- **Applicant Home Clean-Up:** Remove redundant buttons from the applicant home page and optimize the overall visual hierarchy to prevent an overwhelming interface.
- **Unified Component Design:** Ensure that any information shared across users or pages—such as the TTBDO contact card info—uses the exact same component design and styling across the entire system.

Figma Prototyping & System Design Prompt: IPASA System Update (Prosecution Application Number & Refinements)

- **IPOPHL Application Number for Prosecution Stage:** When a case transitions into the prosecution stage—meaning it has already been officially filed with the Intellectual Property Office of the Philippines (IPOPHL)—the system must use the official **IPOPHL-assigned application number** instead of the internal system case number across all user view panels.

When the top navigation bar background is **maroon**, use the **UPLB logo paired with white font**.
When the top navigation bar background is **white**, use the **UPLB logo paired with maroon font**.

Figma Prototyping & System Design Prompt: Specific Workflow & Interaction Updates

1. Case Handler Notification & File Auto-Upload Correction

- **Removal of Drive Link Notice:** Remove the notification message stating *"No drive linked. Link a folder first to attach files"* from the case handler completion steps. Because files are automatically uploaded to a shared case folder by the system, manual Google Drive linking is completely unnecessary.

2. Prosecution Stage & Application Number Assignment

- **Handler-Managed IPOPHL Application Number:** When completing the "Filed" step for a patent or other IP types, the **Case Handler** must input the official IPOPHL application number during the pre-to-prosecution transition.
- **Removal of Admin Edit Control:** Remove the admin "Edit Info" button previously used for adding the IPOPHL application number. This responsibility now rests solely with the Case Handler during the pre-protection stage.

3. Sidebar Interaction & Navigation Fix

- **Instant Sidebar Auto-Close:** Whenever the side panel or hamburger menu is open and the user clicks *any* button on the screen, the system must **automatically close the sidebar** and **immediately enable/execute the clicked button** in a single click action.
