Figma Prototyping & System Design Prompt: Remarks & Notifications Refinement

1. Unified Remarks & Response Thread Interfaces

- **Cross-Role Interface Parity:** Ensure that the remarks and response threads interface designs are identical and standardized across all relevant user roles (Admin, Case Handler, and Applicant) so that the visual layout, interaction pattern, and thread hierarchy remain completely consistent.

2. Dismissible Notification Popups

- **Quick-Close Buttons:** All popup notifications—such as alerts indicating that a response has been added, a reply has been sent, or a remark was posted—must include a clearly visible close/dismiss button ([x]). This allows users to quickly close the notification immediately so it does not obstruct the screen or block underlying interface elements.

Sidebar Hamburger Interaction & Focus Behavior

- **Immediate Single-Click Action Execution:** When the sidebar or hamburger menu is active and open, clicking any button or interactive space inside the screen must instantly close the sidebar and directly execute the clicked button in a single click, completely eliminating the need for a double-click or an intermediate close action.

Homepage Metrics Display Optimization

- **Streamlined Metric Counters:** The metrics section on the homepage must **only** display three core counters:
    - Number of cases handled
    - Cases filed in IPOPHL
    - Completed / Registered cases
- **Inclusive Scope:** Metrics for filed and registered cases must encompass all IP types rather than being restricted to specific categories.

2. Comprehensive Redundancy Audit & Clean-Up

- **Page-by-Page Audit:** Systematically review every page, view, and tab across all user portals (Admin, Case Handler, and Applicant) to identify and completely remove any redundant UI elements, duplicate buttons, or repetitive informational blocks.
